Visual Inspection Criteria

Using a Fillet Weld Gage

Measuring Weld Reinforcement for a Groove Weld

Welding Technique Information Sheets
**Visual Inspection Criteria**

This section will familiarize the student with inspection criteria that will be applied to the evaluation of their projects. PCC Welding Department utilizes the visual inspection requirements set forth in AWS D1.1. The following criteria are gathered from this source.

**Undercut**

Is a condition where the base metal has been melted away during the welding operation and there is insufficient filler metal deposited to adequately fill the resulting depression. These grooves vary in depth and length. Undercut can be present at a weld-to-weld junction or a weld to base metal junction (toe of weld). Undercut causes a stress concentration point (stress riser) that is a potential starting point for weld cracking.

**Causes:**
- Improper welding technique
- Arc length too long
- Oscillation too abrupt, not spending enough time on the sides of the puddle.
- Amperage too high
- Base material too hot
- **Travel speed too fast**

*Maximum undercut allowed is 1/32” in depth.*

![Undercut Diagram]
**Cracks**

Cracks are caused by stresses in the immediate area that exceed the strength of weld metal or base metal (tensile strength).

Cracks are a major concern because of their ends, which are generally sharp and jagged. With increased stress, the crack can then propagate (travel) in the weld or base metal causing catastrophic (total) failure.

**Maximum Cracks Allowed:** None
**Porosity**
A cavity type discontinuity caused by gas trapped during weld solidification. Due to its spherical shape, porosity is considered the least detrimental discontinuity.

**Causes:**
- Loss of shielding gas
- Base metal contamination (oils, grease, water)
- Too long of an arc length.

*Visual porosity is unacceptable*
Overlap (Also known as: Cold Lap, Roll Over or Cold Roll)

Is the protrusion of weld metal beyond the weld toe or root. Due to its linearity and relatively sharp end condition, overlap represents a significant weld discontinuity.

Overlap is not allowed
**Slag Inclusions**

Slag is a nonmetallic by product of the welding process. If slag is not cleaned out thoroughly before depositing the next pass it can be trapped. Or, if the previous weld(s) have poor weld profile slag can become trapped in the crevices when welded over.

Improper cleaning, improper electrode manipulation or poor bead placement most often causes slag inclusions.
**Weld Profile**

This is an important aspect of welding. Statistics have proven that the weld profile is the cause for more weld failure than internal flaws.

**Reinforcement**
- Minimum: Flush with base metal
- Maximum: 1/8" high

**Bead Contour**
- Smooth transition from bead to bead and weld metal to base metal.

![Diagram of weld profile](image)

- **Desirable** fillet weld profiles.
- **Acceptable** fillet weld profiles.

Width of weld face on individual surface bead, W, max. convexity, C
- W ≤ 5/16" (8MM) ≤ 1/16" (1.6 MM)
- 3/8" to W ≤ 1" (25MM) ≤ 1/8" (3MM)
- W ≥ 1" ≤ 3/16" (5MM)

- **Insufficient throat**
- **Excessive convexity**
- **Excessive undercut**
- **Overlap**
- **Insufficient leg**
- **Inadequate penetration**

Unacceptable fillet weld profiles

Reference AWS D1.1
Using a Fillet Weld Gage
(Flat and Convex Fillet Welds)

Select the size gage that is needed.

Use the Concave side of the Fillet Weld Gage to measure leg size (see picture).

The gage must be sitting flush on the metal to get an accurate measurement.

**Note:** In this picture the weld leg is touching the tip of the weld gage. The weld equals the size of the gage.

Rotate the gage to measure the other leg size.

**Note:** In this picture, the weld is not large enough.

See the *Welding Principles and Applications* textbook for a thorough explanation for the correct use of a fillet weld gage.
Groove Weld Information Sheet

Acceptable butt weld profile.

**NOTE:** Reinforcement (R) shall not exceed 1/8".

Excessive Reinforcement Insufficient Weld Size Excessive Undercut Overlap

WLP Info. Sheet P
**Measuring Weld Reinforcement for a Groove Weld**

The weld gage is being used to measure weld reinforcement in this picture.

The gage is positioned over the weld area and the pointer is extended to contact the weld. The pointer has an indicator line on it that can be read for reinforcement size.

Three pieces of 1/8” filler metal are being used to measure reinforcement. Although this is not a “scientific gage,” it will assist in determining if there is too much reinforcement.
The Weave Technique is not recommended for the Horizontal Fillet.

The Weave Technique is not recommended for the Overhead Groove.

Fillet Weld Information Sheet
In Figure C, Points 1, 2, and 3 represent slag, porosity or lack of fusion.
The Weave Technique is not recommended for the Horizontal Groove.

STRINGER BEAD TECHNIQUE

Overhead Groove

The Weave Technique is not recommended for the Overhead Groove.
II. PICTORIAL ILLUSTRATION OF ACCEPTABLE AND UNACCEPTABLE WELD PROFILES

MAXIMUM SIZE OF FILLET WELD ALONG EDGES

Base metal less than 1/4" thick

Reference AWS D1.1-1998 24.5

The distance between the edge of the base metal and the toe of the weld may be less than 1/16" provided the edge is clearly visible and the weld size clearly verifiable.
