Traveling Waves

1. A particular wave traveling along a string is described by:

   \[ y(x,t) = (0.0060 \text{ m}) \sin\left((0.006 \text{ rad/m})x + (600 \text{ rad/s})t\right) \]

   a. How much time does any particular point in the string take to move between the displacements \( y=+2 \text{ mm} \) and \( y=-2 \text{ mm} \)?

   Ans. There are 2 interpretations to this problem.

   **Interpretation 1:**

   The period, \( T \), for this wave is:

   \[ T = \frac{2\pi}{\omega} = 0.0105 \text{ s} \]

   The displacement from \( +2 \text{ mm} \) to \( -2 \text{ mm} \) is \( \frac{1}{2} \lambda \) and therefore the time elapsed is:

   \[ t = \frac{T}{2} = 0.00525 \text{ s} \]

   **Interpretation 2:**

   This one is more complex. The phase difference between \( +2 \text{ mm} \) to \( -2 \text{ mm} \) is:

   \[ \phi = \pi \left(\frac{0.0040 \text{ m}}{0.0120 \text{ m}}\right) = \frac{\pi}{3} \]

   The time elapsed is related to period, \( T \), by:

   \[ \frac{t}{T} = \frac{\phi}{2\pi} = \frac{\pi}{3} \ldots t = \frac{T}{6} = 0.0018 \text{ s} \]

   b. Determine the amplitude, frequency, period and wave speed for this traveling wave.

   Ans. \( y_m = 0.0060 \text{ m} \), \( f = \frac{\omega}{2\pi} = 95.5 \text{ Hz} \), \( T = \frac{1}{f} = 0.0105 \text{ s} \), and \( v = \frac{\omega}{k} = 1.05 \times 10^5 \text{ m/s} \)

   c. What is the equation for the transverse velocity of any particular point along the string?

   Ans. \( v = \frac{dy}{dt} = (3.6 \text{ m/s}) \sin\left((0.006 \text{ rad/m})x + (600 \text{ rad/s})t\right) \]

   d. What is the maximum transverse velocity of any particular point along the string?

   Ans. \( v_m = \omega y_m = 3.6 \text{ m/s} \)

2. A sinusoidal wave of frequency 500 Hz has a speed of 350 m/s.

   a. How far apart are 2 points that differ in phase by \( \pi/3 \) radians?

   Ans. \( \lambda = \frac{350 \text{ m/s}}{500 \text{ Hz}} = 0.7 \text{ m} \Rightarrow \frac{0.7 \text{ m}}{\Delta x} = \frac{2\pi}{\left(\frac{\pi}{3}\right)} \Rightarrow \Delta x = 0.117 \text{ m} \)

   b. What is the phase difference between 2 displacements at a certain point at times 1.000 ms apart?
Waves on a Stretched String

3. The linear density of a string is $1.5 \times 10^{-3}$ kg/m. The equation of a transverse wave on a string is:

$$y(x,t) = (0.025m)\sin((16\frac{rad}{m})x - (750\frac{rad}{s})t)$$

a. What is the wave speed?

$$v = \frac{\omega}{k} = \frac{750\frac{rad}{s}}{16.0\frac{rad}{m}} = 46.9\frac{m}{s}$$

b. What is the tension in the string?

$$F_T = \mu v^2 = (1.5 \times 10^{-3}\frac{kg}{m})(46.9\frac{m}{s})^2 = 3.30\ N$$

c. What is the average power for this wave?

$$P = (\frac{1}{2})\mu \omega y_m^2 = 12.4\ W$$

4. The equation of a transverse wave on a string is:

$$y(x,t) = (2.0\ mm)\sin((20\frac{rad}{m})x - (600\frac{rad}{s})t)$$

a. What is the wave speed?

$$v = \frac{\omega}{k} = \frac{600\frac{rad}{s}}{20\frac{rad}{m}} = 30\frac{m}{s}$$

b. What is the linear mass density of the string, in grams per meter?

$$\mu = \frac{F_T}{v^2} = \frac{15\ N}{(30\frac{m}{s})^2} = 1.67 \times 10^{-2}\ \frac{kg}{m}$$

c. Determine the average power transmitted by this wave.

$$P = (\frac{1}{2})\mu \omega y_m^2 = 0.36\ W$$

d. Demonstrate that this transverse wave satisfies the wave equation:

$$\frac{\partial^2 y}{\partial x^2} = \frac{1}{v^2} \frac{\partial^2 y}{\partial t^2}.$$

The Wave Equation:

5. Consider the following wave:

$$y(x,t) = (0.05m)\sin((5.0\frac{rad}{m})x - (10\frac{rad}{s})t)$$

a. Verify that this wave satisfies the wave equation:

$$\frac{\partial^2 y}{\partial x^2} = \frac{1}{v^2} \frac{\partial^2 y}{\partial t^2}$$

$$\frac{\partial^2 y}{\partial x^2} = -(5.0\frac{rad}{m})^2(0.05m)\sin((5.0\frac{rad}{m})x-(10\frac{rad}{s})t)= -(1.25m^{-1})\sin((5.0\frac{rad}{m})x-(10\frac{rad}{s})t)$$
\[
\frac{1}{V^2} \frac{\partial^2 y}{\partial t^2} = -\left(\frac{10 \text{ rad}}{s}\right)^2\left(0.05 \text{ m}\right) \sin\left((5.0 \text{ rad/m})x - \left(\frac{10 \text{ rad}}{s}\right)t\right) = -\left(1.25 \text{ m}^{-1}\right) \sin\left((5.0 \text{ rad/m})x - \left(\frac{10 \text{ rad}}{s}\right)t\right)
\]

b. Use the wave equation to determine the speed of the wave.

\text{Ans. Setting the above equations together, and not assuming a priori that } v = \omega/k, \text{ leads to:}

\[
\left(\frac{10 \text{ rad}}{s}\right)^2\left(0.05 \text{ m}\right) = \left(5.0 \text{ rad/m}\right)^2\left(0.05 \text{ m}\right) \Rightarrow v = \sqrt{\frac{10 \text{ rad}}{s}} = 2.0 \text{ m/s}
\]

c. Calculate the frequency, wavelength and period for this wave.

\text{Ans. } y_m = 0.05 \text{ m, } f = \frac{\omega}{2\pi} = 1.59 \text{ Hz, } \lambda = \frac{k}{2\pi} = 0.796 \text{ m, and } T = \frac{1}{f} = 0.629 \text{ s}

d. Consider a 2\text{nd} wave (with same frequency and wavelength) traveling in the same direction, where \( y_{2\text{max}} = 0.01 \text{ m} \) and \( \phi_2 = \pi/3 \). Construct a phasor diagram for the combined waves.

\text{Ans.}

![Phasor Diagram]

e. What is the amplitude of the resultant wave?

\text{Ans. } y' = \sqrt{y_1^2 + y_2^2 - 2y_1y_2\cos\left(\frac{\pi}{3}\right)} = 0.0557 \text{ m}

\textbf{Standing Waves}

7. A string is attached to a string vibrator (f=120 Hz) at one end and fixed at the other. The length of the string is 1.2 m.

a. What wavelengths will satisfy the standing wave condition for the string?

\text{Ans. } L = n\left(\frac{\lambda}{2}\right) \{\text{where } n=1,2,3,\ldots \text{ etc.}\}

b. What is the maximum wave speed that will produce a standing wave in this string?

\text{Ans. For the same frequency, the greatest wavelength will produce the maximum speed:}

\[
\text{when } n=1, \lambda = \frac{2L}{n} = 2.4 \text{ m and } v = \lambda \cdot f = (2.4 \text{ m})(120 \text{ Hz}) = 288 \text{ m/s}
\]

c. What string tension will correspond to the wave in (b) is the linear density of the string is 2.5x10^{-4} \text{ kg/m}?

\text{Ans. } F_T = \mu v^2 = (2.5 \times 10^{-4} \text{ kg/m}) (288 \text{ m/s})^2 = 20.7 \text{ N}

d. What string tension would correspond to a standing wave that produces 6 nodes in the string?

\text{Ans. For 6 nodes, } n=5, \lambda = \frac{2L}{n} = 0.48 \text{ m and } v = \lambda \cdot f = (0.48 \text{ m})(120 \text{ Hz}) = 57.6 \text{ m/s}

\text{The tension in the string would be: } F_T = \mu v^2 = (2.5 \times 10^{-4} \text{ kg/m}) (57.6 \text{ m/s})^2 = 0.829 \text{ N}
