- [Dog star rising: the canine genetic system.](#)
 By: Sutter, Nathan B.; Ostrander, Elaine A.. Nature Reviews Genetics, Dec2004, Vol. 5 Issue 12, p900-910, 11p, 1 chart, 2 diagrams, 3 graphs; Abstract: Purebred dogs are providing invaluable information about morphology, behaviour and complex diseases, both of themselves and humans, by supplying tractable populations in which to map genes that control those processes. The diversification of dog breeds has led to the development of breeds enriched for particular genetic disorders, the mapping and cloning of which have been facilitated by the availability of the canine genome map and sequence. These tools have aided our understanding of canine population genetics, linkage disequilibrium and haplotype sharing in the dog, and have informed ongoing efforts of the need to identify quantitative trait loci that are important in complex traits. [ABSTRACT FROM AUTHOR]; DOI: 10.1038/nrg1492; (AN 15229801)

- [Devising a genetics game plan.](#)
 By: Cargill, John; Thorpe-Vargas, Susan. Dog World, Sep98, Vol. 83 Issue 9, p20, 5p, 1 chart; Abstract: Part IV. Presents information on the options in controlling the transmission of genetic diseases among dog communities. Common diseases among various dog breeds; Steps in fighting the genetic diseases; Policies regarding disease control among dogs. (AN 915359)
